

THE PROBLEM: Attention is Permutation Invariant

The cat sat

✓ Original

sat The cat

✗ Scrambled

=

SAME
attention
outputs!

cat sat The

✗ Scrambled

Root Cause: No position information → Order doesn't matter!

THE SOLUTION: Four Requirements for Position Encoding

1 Inject Position Info

Add unique pattern
to each position

2 Parallel Computation

No sequential
dependency

3 Any Sequence Length

Works for
10 or 1000 words

4 Relative Positions

Preserves distance
between words

Position as
added signal

Key Insight: Position can be a feature (added signal), not a process (sequential)
