

# Contrastive Search: How It Works

## Step 1: Get top-

- city: 0.45
- town: 0.18
- area: 0.15
- place: 0.12

Step 2: Get top-  
α = 0.6

$$\text{score} = (1-\alpha) \times P(\text{token}) - \alpha \times \text{similarity}$$

city:  $0.4 \times 0.45 - 0.6 \times 0.92 = 0.372$   
town:  $0.4 \times 0.18 - 0.6 \times 0.75 = 0.378$   
area:  $0.4 \times 0.15 - 0.6 \times 0.65 = 0.330$   
place:  $0.4 \times 0.12 - 0.6 \times 0.50 = 0.312$

## Step 2: Compute similarity to recent context

- Context: "the Winner": "town" (high prob, lower similarity)
- city: 0.92 (cosine similarity)
  - town: 0.75 (cosine similarity)
  - area: 0.65 (cosine similarity)
  - place: 0.60 (cosine similarity)

*Key Insight: Balance probability (coherence) with diversity (novelty)*  
 $\alpha=0$ : Pure greedy |  $\alpha=0.6$ : Balanced |  $\alpha=1.0$ : Maximum diversity
